DWG is the name for the family of Autodesk's 3D drawing programs, which includes AutoCAD, Inventor, and Inventor Pro. The other programs of the DWG family are AutoCAD LT and Fusion 360. In the 1970s, Autodesk acquired numerous smaller CAD software companies and had their programs packaged into a single product. A list of Autodesk products at that time includes: 2D: AutoCAD 2D 2D/2E: AutoCAD 2D/2E 3D: AutoCAD 3D 3D/3E: AutoCAD 3D/3E 4D: AutoCAD 4D Architecture: AutoCAD Architecture Arts: AutoCAD Arts Compact: AutoCAD Compact ESP: Autodesk Environments Software Platform Electronics: AutoCAD Electronics Electronics/Design: AutoCAD Electronics/Design Fusion 360: AutoCAD LT/Fusion 360 Investor: AutoCAD Investor Inventor: AutoCAD Inventor Inventor Pro: AutoCAD Inventor Pro Inventor Design: AutoCAD Inventor Design Inventor Mechanical: AutoC

How do I get access to the dictionary? A: In the class B, try self.dict = A.dict Q: Inner Join Linq? I am trying to make a inner join using linq, but I am getting error. Open Autocad and begin the adding process. With the Autocad starting, you can see that the file extension of the program will be.dwg and you can click on the "Save" button to save it to your desired location. Finally, I suggest you to use WD My Passport Wireless hard drive to save the Autocad file to a removable drive. The advantage of this approach is that the Autocad file cannot be accessed easily by others. As an alternative method, you may also use Autodesk Fusion 360, since this program is more powerful than Autocad. This program will support both Autocad LT 2016 and 2017 and Autocad LT 2019. As you can see, in order to use this method, you need to download Fusion 360 first. To download Fusion 360, please see the links below: Q: Reading a file with Perl and printing every second word I've been working on writing a script which reads a file with names and occupations and prints a directory of names out in a file. It has to read it in and find the name of every second word of the text file, and then print that name out in the file. Text file example: hello, John shopping, Ryan shopping, Ryan shopping, Ryan The Output should be: hello, Ryan shopping, John My current code:

```
#!/usr/bin/perl -wT use strict; use warnings; use 5.012; # Open the file open my $fh, "sample.txt" or die "cannot open file: $!"; # Read the file while () { chomp; my @words = split /\W+/; my @names = split /./,$words[1]; print @names; } close $fh;
```

 What's the best way to do this? I'm not allowed to use a library, but if there's a way to do it with an existing module I would love to use it.
