A cad sheet can be a collection of one or more elements. There are two types of sheets: on-screen, or non-persistent sheets, and paper sheets. The on-screen sheet is the "active" sheet. The document or view to which the current selection is displayed is the "active" sheet. When a sheet is created, its elements are associated with the active document or view. When a sheet is deleted, all its elements are removed from the active document or view. An element may be associated with more than one sheet, so it will appear as more than one element in the associated sheet list. Sheet formats and sizes can be set with properties,

---

just like elements, such as page width or page height. Sheet formats and sizes can be changed during drawing or editing. Sheets are given names based on the active document or view that is associated with them. In some cases, a sheet name cannot be changed, but an alternate name can be defined that is not visible when the sheet is selected. The sheet name is editable when the sheet is displayed in the sheet list and while editing. Lines and blocks AutoCAD Cracked Accounts includes functions to manipulate lines and blocks. Lines and blocks are the fundamental geometric building blocks of a drawing. Lines form the edge of a block, and blocks form the boundaries of areas in the drawing. A line is a line segment (which is not closed), or part of a line, that is defined by two points. The length

---

of the line is the distance between the two points. The term "line" is used interchangeably with "edge." A line segment is described by a start point, an end point, and a direction. A block is a closed line segment, or part of a closed line segment, that has a defined "starting corner" and "ending corner." A block starts at a corner point and extends into a line segment. Blocks are used in 3D modeling, making them useful for creating model geometry. Blocks can be modified by selecting a block and applying transformations. A transformation alters the shape of the selected block and optionally rotates it. Once a block is transformed, it is no longer a closed line segment, and is instead a polyline, meaning that it is a closed series of line segments. The intersection of a polyline with any closed line

---

segment is either the point of intersection between the polyline and the line segment, or a point if the polyline does not intersect the
