Cluster C viruses are phylogenetically related to lentiviruses, and they are important pathogens that infect humans and nonhuman primates. In addition to pathogenesis in lymphocytes, Cluster C viruses are major causes of neurological disease in HIV-infected humans. The molecular bases for their pathogenic potential are unknown, although recent in vitro studies have implicated chemokine receptors and the small heat shock protein 70 (Hsp70) as potential cofactors for viral dissemination and persistence. The ability of these viruses to infect dendritic cells (DC) has been demonstrated, but not much is known about their pathogenic potential in vivo. We show here that DC, when exposed to serum from AIDS patients infected with a dendritic cell tropic Cluster C virus, can become infected with the virus. Furthermore, we demonstrate that these cells can be infected in vivo following intraperitoneal injection. These results provide direct evidence that dendritic cells are targets for Cluster C virus infection and may contribute to the immunopathogenesis observed in patients infected with these viruses.Q: Export hyperlinks and tables to CSV - Free software (Outlook, not Excel) Is there a simple program (free software, not office) to do the following: export (or email) hyperlinks and tables (from Excel) to CSV? import hyperlinks from hyperlinks.com import tables from A: I use the following Excel macro to export/import hyperlinks and tables to CSV for both Excel and Outlook. Sub ExportTable(ByVal SourceTable As Range, ByVal Destination As Range) Const COLUMNS\_HEADER As Integer = 1 Dim Sheet As Excel.Worksheet, Rng As Excel.Range Dim ColCount As Integer Dim RngArr() As Excel.Range Set Sheet = ThisWorkbook.She
