ArchiCAD 13 Crack For Windows Full Software Download. ArchiCAD 19.3.255 Crack With Serial Number.Q: Can't replace all characters with the same prefix in a string in Ruby I have a string that contains all these characters, which start with certain characters like '#'. Here's an example. I have the following code. while name = gets name = name.gsub(/^#{fullname.upcase}/, \$&) name = name.gsub(/, "/, "" end When I run the code, I can confirm that I can replace the value of name and it matches with the name. In the end, I am not sure if there's a problem because I have this code in different places. The problem is that this one line of code replaces the specified prefix with multiple occurrences of that prefix. Can anyone tell me what the problem is? A: This line has a couple of issues. name = name.gsub(/^#{fullname.upcase}/, \$&) The first issue is that name.upcase is evaluated first, then the result is assigned to name. So you're actually trying to do this: name = name.gsub(/^#{name.upcase}/, \$&) You probably want to capture the result of name.upcase in a separate variable, then reuse that result. Otherwise you'll be changing the value of name as well as your pattern. name\_upcased = name.upcase name = name.gsub(/^#{name\_upcased}/, \$&) The second issue is that when you call.gsub with a block, \$& is evaluated to the result of evaluating the block. What you want is for the block to get substituted, so you'll need to wrap it in parens to prevent it from being evaluated. name = name.gsub(/^#{name\_up
